

Agent Handbook — 04 Patient Access

Handles patient-access tasks — eligibility, registration support, and a **deterministic Good Faith Estimate** under the No Surprises Act — behind an identity gate and an access-rep gate. Maturity: Demonstrated + Deployable-by-design; production-readiness (CSV/CSA, IdP, live connectors, pen test, HITRUST) is the engagement; AWS BAA precedes any PHI.

Workflow + human gate

Verify patient identity before any disclosure → check eligibility → compute a **deterministic Good Faith Estimate** (No Surprises Act) from the actual rate/benefit data (not model-generated numbers) → assemble registration support → **suspend at the Access-Rep gate. Named human gate:** Access Rep. The GFE is deterministic by design so the estimate is reproducible and auditable.

Systems / connectors (with standards)

- **EHR / FHIR** — Epic / Oracle Health via Amazon HealthLake (FHIR R4): patient, coverage, scheduling.
- **Payer** — **X12 270/271** (eligibility/benefit); rate/benefit data for the GFE.
- **Identity** — member/patient identity verification before disclosure.

Workforce roles to map in the IdP

PATIENT_ACCESS_REP (the gate). Map to custom:hpp_role.

Withheld authority (what it never does)

The **GFE is deterministic** — the agent does not invent prices; it computes from real rate/benefit data. It **never discloses patient data without passing the identity gate**, and the Access Rep owns any consequential registration/financial commitment.

Deploy (fixture mode, no PHI)

scripts/build_lambdas.sh

scripts/deploy.sh 04-patient-access dev portable native s3://my-cfn-staging/hpp
10.33.0.0/16

- Params: infra/cloudformation/params/04-patient-access.json · Terraform: terraform apply -var-file=envs/04-patient-access.tfvars
- VPC CIDR 10.33.0.0/16.

Human-gate smoke test

1. Attempt a disclosure **before** identity verification → confirm the **identity gate** blocks it.
2. Sign in as a seeded PATIENT_ACCESS_REP; verify identity; compute a GFE → confirm the estimate is **deterministic** (same inputs → same output).
3. Drive a gated action → run **suspends** at the Access-Rep gate; HITL item appears.

4. Approve → proceeds; approval written to the **append-only PHI-masked audit**. Reject → no action.

Key regs

HIPAA Privacy/Security, HITECH; **No Surprises Act** (Good Faith Estimate); **Section 1557** (language access / nondiscrimination); identity-proofing best practice.

Go-live checklist

- ☐ AWS BAA + SI BAA executed; no PHI before both.
- ☐ IdP federated; PATIENT_ACCESS_REP mapped to custom:hpp_role.
- ☐ Live connectors validated (Epic/Oracle Health; X12 270/271); GFE rate data wired.
- ☐ Identity-proofing flow validated; Section 1557 language-access reviewed.
- ☐ CSV/CSA signed off; HITL SLA ratified; Guardrail tuned.
- ☐ Pen test + HITRUST/SOC 2 evidence assembled; observability + runbooks adopted.
