

Clinical-Administration

Summarizes charts, prepares visits, coordinates referrals, drafts discharge documentation — a clinician signs.

51.9%→38.8%

ambulatory burnout after 30 days with an ambient AI scribe (263 clinicians, 6 systems)

~30 min/day

documentation time saved per provider (UW Health);
>15% less note-composition time

+0.49

additional visits per week per clinician associated with ambient AI documentation

How we solve it

load_chart → check_consent → produce_artifact → compliance_check → [Clinician Sign-off gate] → finalize

Outcomes

- Less documentation / inbox burden
- Cleaner, timelier care transitions
- Clinician-signed, grounded notes
- Consent-safe handling of sensitive data

The bright line

Clinical artifacts are drafts a clinician signs — `ehr.draft\_note` is a gated draft; no order entry, no autonomous signing.
