

Care Management & Population Health

Identifies care gaps, stratifies risk (HCC/RAF), surfaces SDOH, prepares outreach — a care manager owns the plan.

>half

reduction in Black patients flagged for extra care by a widely used biased risk algorithm (Science 2019)

26.3%

more chronic conditions in Black vs equally-ranked white patients under that algorithm

>80%

of health-system execs prioritizing agentic AI for care delivery (Deloitte)

How we solve it

load_patient → check_consent → identify_gaps → fairness_screen → draft_artifacts → compliance_check → [Care Manager gate] → finalize

Outcomes

- More closed care gaps (Stars)
- Fairer, auditable risk stratification
- Defensible under Section 1557
- Care-manager-owned plans

The bright line

Risk stratification is fairness-screened and care-plan writes are gated; the care manager owns the plan — the agent never assigns risk autonomously.
